

MIMS[®]

Minimally Invasive Micro Sclerostomy

MIMS[®] STORY

Dr Douglas Argyll Robertson⁵ (1837-1909) was a Scottish Ophthalmologist and surgeon. Dr Robertson was the first to publish a description including post-op results following the use of a trephine in the surgical treatment of glaucoma in late 19th Century. This would create a small hole in the sclera (anterior sclerotomy) that would drain aqueous humor to lower IOP.

At the turn of the 20th Century, Dr Robert Henry Elliot⁶ (1864 – 1936) whom was a British ophthalmic surgeon and also an expert on snake venom published his work on Sclero-corneal trephining in the operative treatment of glaucoma

Dr Yossi Glovinsky began his journey in 2012 to redefine this technology with new innovative materials and engineering techniques.

150 years later we are proud to introduce MIMS[®] - Minimally Invasive Micro-Sclerostomy, a disruptive technology for the treatment of Glaucoma.

It is what we learn from History that makes us today.
